Exponentials/Logarithms Overview – September 14, 2016

## 1. Definition

- (a) e is a real number (about 2.7).
- (b)  $e^3 = e \cdot e \cdot e$ , and  $e^{0.5} = \sqrt{e}$ . So  $e^{3/2} = \sqrt{e^3}$ .
- (c)  $e^x$  can be similarly defined for all rational numbers, and filled in for irrational numbers by taking limits.
- (d)  $\ln x$  is the inverse function of  $e^x$ . This means that  $\ln e^x = e^{\ln x} = x$ .
- 2. Useful values and limits.

$$\begin{split} e^0 &=& 1, \qquad \lim_{x \to \infty} e^x = \infty, \qquad \lim_{x \to -\infty} e^x = 0 \\ \ln 1 &=& 0, \qquad \ln e = 1, \qquad \lim_{x \to 0+} \ln x = -\infty, \qquad \lim_{x \to \infty} \ln x = \infty. \end{split}$$

Note:  $\ln x$  is not defined for  $x \leq 0$ !

#### 3. Change of base

(a) 
$$2^x = (e^{\ln 2})^x = e^{x \cdot \ln 2}$$

(b) 
$$\log_2 x = \frac{\ln x}{\ln 2}$$

In both formulas, 2 can be replaced by any positive number.

## 4. Derivatives and integrals

$$\frac{d}{dx}e^{x} = e^{x}, \qquad \frac{d}{dx}\ln x = \frac{1}{x}$$

$$\int e^{x} dx = e^{x} + C \qquad \int \frac{1}{x} dx = \ln|x| + C$$

### 5. Derivatives in other bases:

We consider  $e^x$  and  $\ln x$  rather than, say,  $2^x$  and  $\log_2 x$  because their derivatives and integrals have these natural forms. Compare with the derivatives of  $2^x$  and  $\log_2 x$ :

$$\frac{d}{dx}2^x = \frac{d}{dx}e^{x \cdot \ln 2} = \ln 2 \cdot e^{x \cdot \ln 2} = \ln 2 \cdot 2^x$$

$$\frac{d}{dx}\log_2 x = \frac{d}{dx}\frac{\ln x}{\ln 2} = \frac{1}{x \cdot \ln 2}$$

## 6. Fundamental identities:

$$e^{x+y}=e^x e^y$$
 (i.e.,  $e^x$  "turns + into ·")  
 $e^{xy}=(e^x)^y$   
 $\ln xy=\ln x+\ln y$  (i.e.,  $\ln x$  "turns ·into +")  
 $\ln x^y=y\ln x$ 

# 7. Graphs.

(The graph of  $\ln x$  is that of  $e^x$  flipped over the line y = x!)
